# MUMS FOR 1958

## TERMS AND CONDITIONS OF SALE

SOLD ONLY IN MULTIPLES OF 50 OF A VARIETY. PRICES QUOTED F.O.B. GROWING STATION AND SUBJECT TO CHANGE WITHOUT NOTICE. PRICE VARIES DEPENDING ON QUANTITY OF EACH VARIETY ORDERED.

CHANGES or CANCELLATIONS on orders must be received at least 30 days prior to shipping date. 2% discount for payment 10 days from date of invoice. Net 60 days.

Any cash orders specifying shipment via Parcel Post or Parcel Post Special Delivery or other methods requiring prepayment of carriage charges must include cost of same.

Sliding scale of prices for different quantities of each variety, as shown, is the only variation in pricing.

## SHIPPING INFORMATION

All cuttings are shipped Railway Express, Air Freight or Air Express, collect. If you have any preference, designate on your order; otherwise our shippers will use their best judgment.

Our cuttings are supplied from experienced growers and shippers. The transportation company accepts them in good condition. If there is any shortage or damage from freezing or heating, have the carrier write a full description on a damage report. When possible, inspect the shipment before signing the delivery receipt.

(1) DAMAGE REPORT. (2) ORIGINAL INVOICE, and (3) UNIFORM BLANK FOR PRESENTATION OF LOSS AND DAMAGE CLAIMS should be forwarded to the carrier within 5 days.

YOU MUST FILE CLAIMS, as our responsibility ceases when the carrier accepts shipment. We cannot be responsible for the safe arrival of your cuttings.

## DISCLAIMER

In keeping with trade custom, and as we exercise no control over the conditions under which stock is planted and grown by the purchaser, we will not be responsible for the results produced. Our liability in all instances is limited to the purchase price of the stock.

We will not be responsible for any errors or omissions. Orders are subject to pro-rata delivery if conditions in our sole judgment justify it, either on account of short crop, prior sale or for any other reason.

We will not be responsible for delays, damages or loss in transit. Our liability ceases upon delivery to the common carrier. Claims for deterioration in transit must be made against carrier, and we assume no responsibility for them. NO RETURNS OF CUTTINGS WILL BE ACCEPTED. All orders subject to acceptance by home office.

In case the buyer's financial standing appears unsatisfactory to the seller at any time before shipment, the seller reserves the right to demand payment in advance; and, failing to receive it from the buyer, to declare order null and void without notice to the buyer notwithstanding acceptance and/or acknowledgment having been made.

## CHECK ACKNOWLEDGMENTS

It is most important to read our acknowledgment of your order. This indicates date our grower estimates delivery can be made. It frequently happens that we have to list a different delivery date than the one called for, and it is necessary that you know this when the order is confirmed.

## VARIETY LISTINGS

Both Pompon Types and Standards in our list are grouped by color and number of weeks normally required to flower when grown under controlled blooming programs. 8-week varieties require 8 weeks to come into bloom after shading is started for summer and early fall blooming, or 8 weeks after lights are discontinued and shading is started for late winter and spring blooming. 9-week varieties require 9 weeks, 10-week varieties require 10 weeks, etc. These groupings are based on conditions at the 40th parallel, and there would be some variations in localities very much farther north or south of this latitude. Normal blooming dates are also indicated.

## SUBSTITUTIONS

We will substitute varieties as good or better for any items not listed in this catalog, unless order is marked **No Substitutions.**

## ABBREVIATIONS USED IN OUR LIST

L. — Large  
S. — Small  
M. — Medium  
T. — Tall

Br. — Bronze  
Lav. — Lavender  
Pk. — Pink  
Wh. — White

Yel. — Yellow  
Dk. — Dark  
Dec. — Decorative  
Inc. — Incurved

Int. — Intermediate  
Anem. — Anemone  
Pom. — Pompon  
Sgl. — Single

# *The Best in Mums for '58*

## **General Cultural Information**

Start out with the best cuttings available. Our stock is produced and shipped by Chrysanthemum Specialists. These top grade cuttings are carefully packed and labelled. There are none better.

### **CARE OF CUTTINGS WHEN RECEIVED**

Upon arrival of the cuttings examine them immediately. If they have been delayed in transit, some damage may have occurred along the way. If the roots should be dry and plants are wilted, soaking them in about 1 inch of water for about 1 hour will revive them greatly.

If they should have become heated and some fungus has developed, dipping them in a solution of Fermate, 2 table-spoons-full to 1 gallon water, will stop any further spread of the fungi. Of course, if the shipment has been delayed too long and the plants have stretched or turned yellow, or should be badly frozen, file claim with the Transportation Company immediately.

### **SOILS**

Chrysanthemums will grow in about any type of soil provided it has reasonable drainage. Steam sterilization before planting, if it is possible, will prevent disease and weed growth. The soil should be low in nitrates at planting time, but should be built up by feeding after the plants have made several inches of new growth.

### **WATERING**

Chrysanthemums require lots of water, especially when grown on raised benches using a good porous, well drained soil. Water heavily after planting and then spray or sprinkle plants for a few days until they have taken hold. Do not let them wilt if possible. Once the foliage gets heavy do not water overhead and by no means allow the foliage to be wet overnight. Keep the foliage dry and the soil moist.

### **PLANTING AND SPACING**

Plant cuttings shallow, not over one inch deep and directly to permanent benches if possible, soon as the cuttings are received. Keep roots of the cuttings protected at all times while planting. Exposure, especially to hot sun, and wind, will destroy the root action in a few seconds.

Be sure not to let them stay too long in this crowded condition. Shading newly planted stock on very hot sunny days for the first couple of days will help considerably, as well as frequent spraying with water over the tops of the cuttings. They should not be allowed to wilt.

Spacing will depend on the quality desired as well as the time of year and number of pinches. Standards are generally spaced 7 x 8 or 8 x 8, grown two stems to the plant. Some growers allow three flowers to come on the outside rows where light is more abundant. For single stem culture 6 x 6 or 6 x 7 is ample. Pompon spacing depends on method of pinching and varieties. Some varieties have much heavier foliage than others and require more space. For the one pinch method 7 x 8 or 8 x 8 is fairly standard. For 2 pinch method 8 x 9 or 9 x 9 will be sufficient. For single stem production 4 x 6 or 4 x 7 is about right. The general rule followed is to give each flowering shoot approximately 20 sq. in. of space.

### **SUPPORT**

To grow good flowers with good stems it is essential to keep the plants properly supported at all times.

The wires and cross strings method is least work, most economical and practical. Start supporting the plants soon as they are established and either add additional layers of wires and cross strings or move the first layer up about every 10 to 15 days, depending on growth.

### **SHADING**

When using shade on Pompons, the shade must be continued until the whole bed is uniform in color. In the case of large Mums, the shade can be removed as soon as all the buds are selected.

### **PINCHING**

Pinching means the stopping of the upright growth of the plants by cutting or breaking off the growing tip of the plant stem. It is done to increase the number of stems per plant, to control type of bud formation, and to keep plants shorter in growth. This will cause a number of breaks or shoots to appear. The plants should be pinched soon after the cutting takes hold and starts to grow freely. Usually only the tip of the stem is removed when under fast modern production. Do not pinch down into the hard stem. Thinning the breaks down to about 3 shoots to the plant on pompon varieties and 2 shoots on the Standard usually gives best results. Normal pinch dates are given in the general listing of varieties. For the off season cut flowers or pot plant program refer to pinch dates in the desired schedule.

### **INSECTS — PREVENTION AND CONTROL**

It is very important to keep the stock clean and free of injurious insects. The best way to insure this is to start spraying the plants about two weeks after planting and to spray at intervals of every two or three weeks until color shows. You will find it easier to keep them clean than to wait until infestation shows up and causes damage, and then have the task of trying to get the best of it.

### **DISBUDDING**

It is extremely important that you take the time to select the flowering buds on Standards as soon as they appear and are sizeable enough to remove. If the crop was planted and pinched on or near the recommended dates, flower the first bud that appears. In other words, as soon as a bud of any kind appears, remove all side shoots and let the center bud flower.

### **WHAT CAUSES PREMATURE BUDDING OF CHRYSANTHEMUMS DURING THE SPRING MONTHS, AND WHAT TO DO TO PREVENT IT**

Bud initiation can occur any time during the spring months, whenever your temperatures in the greenhouses are consistently 60 degrees Fahrenheit or above, and the days are short enough to initiate bud setting. These conditions can occur any time up until May 1st depending upon the variety and the locality in which they are being grown. Cuttings for spring pots will not be seriously affected if they contain a small bud or if they develop a small bud after potting. This will be removed at the time the pinch is made and breaks from the nodes will be relatively free of buds at this time of the year. *Recommendations for lighting should still be observed.* Lighted cuttings from the propagators will initiate buds much more rapidly if they are not lighted at the time of potting. Cuttings for outdoor plantings, stock purposes, cut flower production, or pot plants under glass should be lighted for at least 3 hours at night with a minimum of 10 ft. candles, keeping in mind that at no period should there be over 8½ hours of continuous darkness. It is well to remember that any factor that will harden a cutting down, such as dryness of the soil media or lack of soil nutrients, will also encourage early bud initiation. Getting the cutting off to a good start is of prime importance. A complete fertilizer after the roots are well established will help to keep the cuttings vegetative.

# NEW INTRODUCTIONS and ADDITIONAL CATALOG LISTINGS

## Pompons, Decoratives, Singles and Anemones

### GROWER'S AGREEMENT

New varieties indicated by (GA) are subject to conditions and limitations of a GROWER'S AGREEMENT. Such signed agreements are required in advance of shipments. Cuttings of these new varieties will be available for delivery May 12, 1958.

**INTRODUCING THE NEW BIG TEN SERIES**

Garden Varieties by DePetrus

This series is designed especially for the home gardener with advanced interest in garden mums. It consists of varieties that respond well to disbudding to produce the large type football blooms. To add to their versatility, many of these varieties will prove valuable commercial pot plants, as well as early disbuds for outdoor and greenhouse flowering.

**OHIO STATE (Oct. 15)**

Large golden cactus decorative. Luxurious dark green foliage. Compact, sturdy grower; lends well to disbudding or spring pot plant culture.....41

**MINNESOTA (Oct. 10)**

Large white incurved pompon. Lends well to disbudding; particularly suitable for spring pots.....39

**IOWA (Oct. 15)**

Bright lemon medium incurvd. Makes sturdy compact pot plant, especially useful in spring months. Productive and beautiful as garden disbud.....41

**MICHIGAN STATE (Oct. 14)**

Large white decorative pompon. By disbudding can reach 4" bloom. Responds well, and makes a beautifully shaped pot plant.....39

**NORTHWESTERN (Oct. 10)**

Large full bronze incurved. Good substance. Early flowering variety of compact growth. Ideal Football Mum.....42

**INDIANA (Oct. 10)**

Large amber bronze, full cactus type. Real novelty for home gardener. Has commercial value as Spring pot plant....42

**PURDUE (H) (Oct. 12)**

Large full incurved; lively bronze. Naturally sturdy and compact. Excellent for plant, and ideally suitable for background plantings.....42

**WISCONSIN (Oct. 15)**

Large, solid, very formal incurve of rich deep apricot-bronze color. Healthy grower, adaptable to cut flower disbuds and gardens.....43

**ILLINOIS (Oct. 5)**

Large, formal, golden yellow incurve with excellent substance. A credit to the new spring pot plants and large disbud garden mums.....40

**MICHIGAN (Oct. 12)**

Large, clear yellow blooms, fully 4". Not a new introduction, but was added to the BIG 10 SERIES because of its adaptability to disbudding.....41

# YEAR AROUND CUT FLOWERS

This Schedule is set up for those who wish to grow a pinched crop. If you desire to grow single stem method, then plant on indicated pinch date.

We have confined this list to a small number of varieties, which means that these varieties have been grown and approved for off-season blooming by a large number of Growers in various parts of the U.S.A. and Canada, but does not mean that other varieties are of no value in off-season blooming.

We recommend that the 12, 13 and 14 week groups be bloomed only from December thru February, and the 8, 9, 10 and 11 week varieties from March thru November. This method has been found the best for most localities.

Any variety which sets bud readily and uniformly under Cloth House conditions will also respond well at other seasons of the year. If you have a variety which sets bud uniformly under these conditions in your locality, then you can feel sure it will also respond under lights. But if you have a variety which matures over a long period of time, you can be sure to have more trouble in off-season blooming.

The real problem in setting up a Year Around Chrysanthemum Cut Flower Schedule is to allow enough time during poor growing weather to produce the desired stem length as well as the best type of spray formation on Pompons. For this reason it is impossible to set up one simplified Schedule which will work in every locality. If you are located in an area which is blessed with sunshine during November thru March, the same stem length can be reached 4 weeks quicker than in an area where light intensity is low. A good example is Florida versus Northern Ohio.

From May thru October, the difference in light intensities in most localities does not vary enough to make an appreciable difference in stem growth. Therefore, no allowances need be made for geographic locations during those months.

This schedule is based on the average amount of sunshine for Latitude  $40^{\circ}$  —  $45^{\circ}$  North — New England, New York, Pennsylvania, Northern Ohio, Northern Indiana, Northern Illinois, Iowa, Minnesota, Wisconsin, Michigan, Washington and Oregon.

**For every 5 degrees farther south, on any planting made during November thru February, you should allow 7 days less time between pinch and short days. This will compensate for the average amount of sunshine and the angle of the sun's rays in that particular locality. At no time should 10-week varieties and earlier have less than 3 weeks of long days between the pinch and short days.**

Latitude  $35^{\circ}$  —  $40^{\circ}$  North — Southern New Jersey, Delaware, Maryland, Virginia, West Virginia, North Carolina, Kentucky, Tennessee, Southern Indiana, Southern Illinois, Missouri, Kansas, Colorado, Northern Arkansas, Northern Oklahoma, Southern Nevada, Southern Utah, Southern Ohio and Central California.

Latitude  $30^{\circ}$  —  $35^{\circ}$  North — Southern California, New Mexico, Arizona, North Texas, Southern Oklahoma, Southern Arkansas, Louisiana, Mississippi, Alabama, Georgia, South Carolina and Northern Florida.

Latitude  $25^{\circ}$  —  $30^{\circ}$  North — Central and Southern Florida and Southern Texas.

Where the schedule calls for lighting, 60 watt bulbs spaced 4 ft. apart and 30 inches above the plants will give sufficient light. Apply lights 3 hours each night, some time between the hours of 8 P.M. and 5 A.M. as schedule indicates.

# POT MUMS—General Information

Even with limited space POT MUMS can be grown on a continuous production basis the year round, using 5 plants per 6" pot or 4 plants per 5" pot.

## SPACE

Suppose your needs are for fifty 6" pot Mums every two weeks. You would need 16 sq. ft. under lights, or 4 lineal feet of a 4-foot bed. This would require only one 60-watt bulb. To finish the 50 plants, it would take approximately 1 sq. ft. per plant, or 50 square feet (the same for each succeeding two-week period). For example, using Bonnaffon DeLuxe, an 11-week variety, you would count on 14 weeks to bloom and to sell the first 50 plants. With the space available then you are ready to start your next cycle. Following this method you would require only 362½ square feet of bench space to maintain a continuous supply of 50 pot mums every two weeks the year round.

## PRINCIPLES OF GROWTH

For best results use established plants (meaning those with newly developed root systems and new vegetative growth) before making pinch.

Allow about one week from planting to pinch in the summer, from April 1 thru August 15; about two weeks in the fall, August 15 to October 1; and in the early spring, from March 1 to April 1. During the winter months, from about October 1 to March 1, allow *three* weeks from planting to pinch. (Remove the very tip only when pinching.)

As light intensity and duration decrease from summer to winter months, light becomes the limiting factor for plant growth, and additional long day timing must compensate for the lack of light. It has unintentionally evolved that the most important year-round pot plant varieties are in the 9 and 10-week response groups and some are used both for summer and winter flowering. A 10-week variety takes no longer to flower in the winter than it does in the summer once short day treatment is started, but under winter light conditions the development of the flowers utilizes more carbohydrates than the plant is capable of manufacturing during the 10-week period from start of bud initiation to complete development. Consequently, those plants must build up sufficient carbohydrate reserves prior to the start of short days in order to complete full flower development, and this can only be accom-

plished by increasing the number of long days from planting to start of short days.

Very desirable plants can be grown by potting and pinching the same day. This method does not require the use of artificial lights and will shorten the Schedule by ten days.

## SOIL

POT MUMS can be grown in any good mixture of soil and peat. A preferred pot plant medium is a loose, open soil; one that allows for drainage. It is advisable to include sufficient organic matter, such as peat or well rotted manure, to improve water holding capacity.

Very few growers fail to sterilize the potting media before planting, since the hazards of unsterilized soil are unquestionably recognized. Should old bench soil be sterilized for pot use, be sure it does not contain high soluble salts. Such a condition can easily be corrected by heavy leaching, either before or after sterilization.

## PLANTING

Each step in the culture of potted Mum plants has an important direct bearing on all plants breaking and budding uniformly.

First, pots should contain cuttings of the same height and stem diameter. Plant these graded cuttings equal distances apart near the rim of the pot so that each plant has the identical exposure to light to develop symmetrically. In every respect, each plant should receive as nearly identical treatment as the others. Do not permit cuttings to harden.

## TEMPERATURE

Temperature has an even more critical effect on potted plants than on a cut flower crop.

Since flowering uniformity is such an extremely important requisite for a well accepted pot plant, it is absolutely essential that night temperatures be held between 60° and 65° F. just prior to and during the bud initiation period. It is safe to hold minimum temperatures above 60° F. than 1° F. below

# POT MUMS—General Information

60°. Plants should be held at this temperature up to the time that buds can be taken.

In the winter we start out pots on dry raised benches with enclosed bottom heat lines. Our normal day time temperatures are held between 58° and 70°, depending upon the relative brightness of the day; at night, however, the starting benches are covered with black cloth which confines the bottom heat to a limited area overhead and adequately maintains the desired minimum temperatures.

The bottom heat filtrates through the cracks in the bottom of the board bench, which in turn markedly stimulates root action as a result of higher soil temperatures and a more rapid loss of excess soil moisture. A fast initial take-off is important. If the plants hesitate at all, they will not make good pot plants.

Plants in pots are kept in this under cloth area at night until the buds are visible after which they are moved out into the open house area and into a lower night temperature.

By pulling the cloth on after dark and removing it before daylight in the morning, the plants are not deprived of any available daylight and yet get a very uniform temperature treatment. It is easier to maintain sharp control of temperature in a small covered area than it is in a whole house. Lights are also under the black cloth giving warm temperatures at the same time that plants are lighted.

## LOW TEMPERATURE FINISHING

After buds are well defined and selected, it is beneficial to move the pots from the high temperature black cloth area to a low temperature finishing area with minimum temperatures between 50° and 55° F. Under this layout, the remainder of the house not covered with black cloth constitutes the finishing area.

Low temperature finishing does not significantly delay the response or rate of development, but does materially improve flower size, color, and quality during the low light intensity periods.

## PINCHING

After the cuttings are established and growth has started, they are in condition to be pinched. In order to insure responsive uniformity, all pinches should be either a high soft or a roll tip pinch, permitting resulting breaks to arise from the so-called succulent or new wood portion of the plant.

The shoot arising from the upper-most leaf axil on a pinched chrysanthemum plant, when subjected to short day treatment, will be the first to initiate a flower but

with a gradual progression of initiation down the stem. A hard or semi-hard pinch made during the winter months, especially, will force breaks to arise from the woody portion of the stem which in turn are inclined to be vegetative and will not immediately respond to short day treatment.

This is an important concept to practice the year-round, but it becomes especially critical after the middle of winter or early spring months. The progression of responsive shoots on a pinched chrysanthemum plant becomes acutely exaggerated.

Although the single pinch system is universally used, occasionally no pinch is employed and for very large plants the double pinch system is best.

## NO PINCH

The main advantage is larger flowers on varieties like the Indianapolis group. From 6 to 9 cuttings are placed in a 6-inch azalea pot and short days are started about 7 days after potting.

## SINGLE PINCH

This is used by most growers because it is fast and the size of the specimens will satisfy most demands. Five or 6 cuttings are placed in a 6-inch azalea pot and the plants are pinched 7 days after potting. Pinch relatively soft — if pinched too low, there will be fewer breaks. The plants should be shaded the same day they are pinched. In very dark weather the plants may be too short and this can be overcome by lighting for 7 days after pinching, then starting short day treatment.

## DOUBLE PINCH

For large specimen plants this system is preferred. Plant 3 or 4 cuttings in a 6-inch azalea pot and soft pinch after 7 days. Then after 3 weeks pinch again so that only 3 leaves remain on each stem. Start short days at the time of the second pinch.

## UNIFORM BUDDING

Some difficulty in securing uniform budding is sometimes experienced as a result of pinching **too low** and thereby forcing breaks with greater degree of vegetativeness down lower on the stem. These lower breaks are more reluctant to bud than are those which grow out from the upper portion of the stem. They will therefore also get taller than the higher breaks. In winter and spring flowering, particularly, is this important. In some cases uneven flowering in winter is blamed on temperature being too low when it may have been at least partially due to pinching too low. Pinch as soft and as high as possible to produce short breaks that

# POT MUMS—General Information

bud freely. Pinch harder or lower to force vegetative breaks that get taller and bud more slowly and less uniformly. The breaks should come from the new growth and not forced out from the original cutting.

## LIGHTING

Where the Schedule calls for lighting, 60 watt bulbs spaced 4 ft. apart and 30 inches above the plants will give sufficient light. Light 3 hours each night as indicated on the Schedule, keeping in mind that at no time should there be a period of continuous darkness of more than 8½ hours duration. Avoid this by applying lights sometimes between the hours of 8 P.M. and 5 A.M.

## FERTILIZERS

Weekly feeding with a balanced complete liquid fertilizer, winter or summer, is beneficial, starting as soon as plants become established. Frequency of application is as often during the winter as during the other parts of the year, but applied in a more dilute concentration. There are a number of satisfactory fertilizers on the market.

One that has proved successful is a 20-20-20 analysis water soluble fertilizer applied at the rate of ¾ lb. per 100 gal. water during the winter months and 1½ lbs. per 100 gal. during the high light-intensity periods of the spring, summer, and fall. It is advisable to continue feeding up to the time plants are ready for sale.

## DISBUDDING

Most of the varieties in the 9, 10 and 11-week group are disbudded although, here again, there are exceptions. Some growers find that disbudding is not necessary for their particular market. Others claim that there is no sale for plants that are not disbudded. The general practice, however, is to disbud all varieties and to

limit the number of buds left to develop. Our observation has been that this depends almost entirely on the buyers habits. It is more important to leave buds of uniform size when disbudding than to leave buds in identical positions on all stems. A side bud on one stem may be the equal of the center bud on another stem. A minimum of 12 good sized flowers is considered a good plant for a five inch pot although it is possible to get more on certain varieties. This means three breaks per plant, four to a pot. A variety such as Portrait will not always average three breaks and should have an additional plant added especially for winter flowering. It is possible to have Bonnaffon break four to a plant in good growing conditions.

## SMALL POT MUMS

There is ever increasing interest in the flowering of chrysanthemums in 3-inch standard or 3½-inch azalea pots. They are very useful for combination or mixed pots which are an important part of spring bedding plant sales in many parts of the country. In addition there is some interest in selling these as small plants for home decoration in place of the larger sizes.

Immediately after potting, the plants should be soft pinched and short day treatment started. By doing this the plants are kept short—in proportion to the small pot. Many of the 7, 8, 9, 10, and 11-week varieties will be suitable for combination pots, but only the shorter kinds are suitable as plants for the home.

## GARDEN VARIETIES FOR SPRING POTS

These have become an important item for the spring months, particularly for Mothers Day and Decoration Day. A popular sales promotion point features the fact that they can be placed in outdoor gardens to flower again in the fall.

REFER TO SCHEDULE AND RECOMMENDED  
VARIETIES ON PAGE 45

# Year Round Pot Plant Schedule

In the following Schedule we list only varieties that are considered the best with the least manipulation of lights or shade cloth. If taller varieties are grown the pinch should be made about 10 days after short day treatment has begun, such as, the Lace varieties and Indianapolis varieties. If the varieties should be too short for your particular need, the pinch should be made a week to ten days before starting short day treatment.

## S.S.S. AUTOMATIC WATER ROBOT

"IT PROPERLY APPLIES WATER BETTER THAN BY HAND" . . .  
"SAVES MONEY" . . . "SAVES WATERING TIME" . . .  
"RELEASES A MAN TO DO OTHER WORK"

*The S.S.S. Automatic  
Water Robot Has Everything  
Required to Satisfy Every  
Range's Watering Needs!*

### 1—AUTOMATIC SHUTOFF

Saves you time and labor. The Water Robot waters better than manual watering and automatically shuts off at the machine when two benches or beds have been watered as you directed. All done with a 1/3 H.P. electric motor.

### 2—AUTOMATIC SHUT OFF ALARM

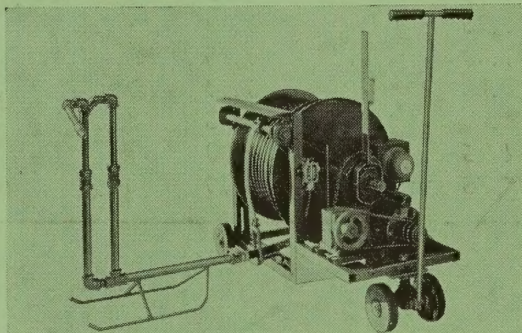

The S.S.S. Automatic Water Robot delivers as much or as little liquid as you require. Water or liquid fertilizer passes freely with no constriction of pressure or volume. The convenient shut off alarm tells you when the job is done.

### 3—AUTOMATIC LEVEL HOSE WINDER

It is not necessary to have the reel aligned perfectly with the bench or walk because the Automatic Level Hose Winder prevents the hose from tangling or piling up on the reel.

### 4—MICRO-SWITCH CONTROLS

Guards against spot flooding. Especially when it encounters an overload, the Robot automatically stops winding . . . automatically shuts itself off.

S.S.S. AUTOMATIC WATER ROBOT

### 5—VARIABLE SPEED DRIVE

Speed of winding can be adjusted from 2 to 3 feet per minute.

### 6—RUBBER-TIRED WHEELS

Makes it easy for one man to move.

### 7—ADJUSTABLE RISER

The telescope-like riser on the watering sled allows quick and easy adjusting of the nozzles at the required height.

### 8—COMPACTNESS

Maximum width of Water Robot is only 24 in. with a 125 ft. reel. Only 28. in. wide with a 200 ft. reel. Easily passes through practically any door or end aisle. Turns completely around in its own 36 in. length.

### PRICE

No. 1 Model — \$675.00 Plus Hose  
No. 2 Model — 690.00

No. 1 Model Reel accommodates 175 ft.  
3/4 inch I.D. Plastic or Rubber Hose.  
No. 2 Model Reel accommodates 250 ft.  
3/4 inch I.D. Rubber hose or 300 ft.  
Plastic Hose.

3/4 in. I.D. Plastic Hose . . . . .49c  
3/4 in. I.D. Rubber Hose . . . . .49c

All Prices F.O.B. Midwest Shipping Point

### ◆ S.S.S. WATER ROBOT

A Robot in operation at one of our satisfied customers.

### GUARANTEE

The S.S.S. AUTOMATIC  
WATER ROBOT is fully  
guaranteed for one full  
year against all me-  
chanical failures.

### ◆ "Time for Fishing"

JOHN FRERIKS  
Babylon, L.I., New York

July 22, 1957

Dear Mr. Skidell:

Your Water Robot gives me much time to go fishing instead of hand watering. I have never had better quality Carnations in my many years of growing. This is due to the efficient performance which the Robot provides. I don't know what I would do without it.

Sincerely yours,  
John Freriks

### ◆ "Save Money"

WEST END GREENHOUSES INC.  
Olean, New York

March 27, 1956

Dear Mr. Skidell;

"Of course it is a terrific labor saver. It has eliminated one water boy at a saving of about \$1,000 per year."

Sincerely yours,  
T. Paul Newman

### ◆ "Efficient Worker"

JOHN F. MICHEL  
Florist  
Fullerton, Maryland

Oct. 3, 1956

Dear Mr. Skidell:

Our Robot has been working every day, all day ever since it arrived. It takes no time out to lunch and is a willing and efficient worker after all the live help have quit for the day. The Robot has proven a good investment and does a fine job.

Before it arrived we were always short handed. I don't know what we would do now, without it.

Very truly yours,  
Ed. Michel

### ◆ "Save Time"

ST. ANTHONY  
GREENHOUSES  
Minneapolis, Minn.

April 3, 1956

Dear Sir:

"It not only gives us more time for other work around the greenhouse, such as disbudding, pinching and tying, but it does a very important job of watering. It applies the proper amount of water over the entire bench."

Yours truly,  
Roger D. Schnabel

### ◆ "Very Satisfactory"

WM. D. REINIGER  
& SONS  
Hatboro, Penna.

March 1, 1956

Dear Mr. Skidell:

"The 'Water Robot' we purchased from you is working out very satisfactory in our rose program."

Sincerely yours,  
Lewis D. Reiniger

### ◆ "Save Labor"

EMIL OBERLE  
E. Meadow, L. I., New York

March 1, 1956

Dear Sir:

"The watering from this machine is very satisfactory and the fact that it releases a man for other work, in these days of high labor costs is very important."

Yours very truly,  
Emile Oberle
